Walshia unidentified species No common name

FAMILY: Cosmopterigidae SUBFAMILY: Chrysopeleiinae TRIBE: [Chrysopeleiini]
TAXONOMIC_COMMENTS: Most of the Walshia in the eastern US cannot be reliably distinguished based on external features and require the examination of genitalia (Hodges, 1978). In addition, W. miscecolorella appears to contain a group of cryptic species (12 BINS currently recognized on BOLD). There are an undetermined number of undescribed species in the W. miscecolorella complex, including at least one that occurs in North Carolina. Many of our photographic records cannot be assigned to species and are placed here at the genus level.
